

Driver flow

```
Bash / user program
  ↓
system call
  ↓
kernel core
  ↓
device driver
  ↓
hardware
  ↓
device driver finishes / waits
  ↓
kernel core
  ↓
system call returns
  ↓
user program / Bash continues
```

Example

```
calls write()
  ↓
Linux kernel receives write syscall
  ↓
kernel finds driver for /dev/ttyUSB0
  ↓
USB/UART driver sends data
  ↓
driver returns status to kernel
  ↓
kernel returns result to echo program
  ↓
echo exits
  ↓
bash shows prompt again
```
